

ISW QUESTIONS

1.-How is this initialization done? (Slide 24 Unit 5)

I believe that one solution could be creating object A, passing in the constructor a null value as B, then creating object B with object A as a parameter and then updating A with this B object. There shouldn't be problems since they are objects and are passed by reference, so the update is reflected. The other way around is also possible, that is, starting with B.
